

1. Today — local development

How a single message travels through the app, and where each part is hosted.

- User / browser
- Frontend / backend
- Database
- External AI

Where each component lives

- ☐ **Your computer** — Browser, Frontend, Backend & Database all run locally (npm run dev).
- ☐ **Anthropic cloud** — Claude Sonnet 4.6, reached over the internet with your API key.
- ☐ **GitHub** — stores the source code, and serves the public *frontend-only* demo (GitHub Pages).
- ☐ **Claude Code cloud environment** — where this was built & tested. Temporary; not where you run it.

Built-in safety net

If the AI key is missing or the internet drops, the backend answers with canned responses — the app never just fails. This is also what the GitHub Pages demo uses (no backend, no key).
