

2. Production — SaaS on your own server

The same core, hardened to serve many paying customers reliably and 24/7.

What changes from local → production

Adds: front door (HTTPS) · backend as several copies · SQLite → PostgreSQL · accounts & billing · always-on watch workers · live data feeds · backups & monitoring.

The core path — **Frontend** → **Backend** → **Database + AI** — is unchanged; production wraps a support cast around it, on infrastructure you own.
